A use case for \valign

Taco Hoekwater

The \TeX primitive command \halign is the backbone of traditional macros for predominantly horizontal tabular material. Its companion primitive \valign can be used for predominantly vertical material, but column-based tabular material is rare so there is no built-in support for it in Con\TeXt. Since I was required to typeset a table using vertical alignment, I wrote a small set of higher-level macros to allow use of \valign in a Con\TeXt-friendly manner.

1. Introduction

From the \TeXbook comes this quote by D.E. Knuth (p. 249, emphasis mine):

"The control sequence \valign is analogous to \halign, but rows and columns change rôles. In this case \cr marks the bottom of a column, and the aligned columns are vboxes that are put together in horizontal mode. The individual entries of each column are vboxed with depth zero (i.e., as if \boxmaxdepth were zero, as explained in Chapter 12); the entry heights for each row of a \valign are maximized in the same fashion as the entry widths for each column of an \halign are maximized. The \noalign operation can now be used to insert horizontal mode material between columns; the \span operation now spans rows. People usually work with \TeX at least a year before they find their first application for \valign; and then it's usually a one-row '{\valign{\vfil\#\vfil\cr...}'}.
But the general mechanism is there if you need it."

Well, it took me a lot longer than that: nearly three decades, in fact. But then I realized that what I needed to score the \valign achievement of an experienced \TeX user is to find data that requires row spanning instead of column spanning.

Armed with that knowledge, I browbeat some of the DocWolves clients into having commission meetings in parallel, on the same day. Then, I convinced them that all items on the separate agendas should have a fixed duration. Finally, some fast talking made sure that they wanted an aggregated overview on a single page. They could not even imagine my motive!

2. The input data

In our pdf creation workflow, data is exported to a Con\TeXt source file, to be processed. The data export code massages the core data a bit to make it easier to process. This could also be done in Lua, but since the export code has to do various parsing jobs anyway, it makes sense to make the Con\TeXt processing as straightforward as possible. In particular, the export code calculates the total
number of needed rows and the required spans based on the duration of the various items.

In the example ConTeXt file that follows, I removed lots of information that is not relevant for this article and changed the text to snippets of poems. The structure remained the same, though.

\startmeetings
[Aanvang={17:00},

\stopmeetings

Note:
In the \TeX input examples below, I will abbreviate the actual poems so that the listings do not become overly large. All important parts of the input are kept, just the actual content is abbreviated.
3. Using `\valign`  

As a start, here is the ‘plain \TeX style’ `\valign`-based code that my processing software could generate (both more and smarter macro definitions would make the input look nicer, but for the purpose of this paper that would just distract from the main topic):

```latex
\def\h#1#2{\vbox{\hsize=#2 \bf \kern 6pt \#1\par\kern 6pt}}
\def\t #1{\vbox{\hsize=1cm \hrule \kern 6pt \#1\par\kern 6pt}}
\def\c #1{\vbox{\hsize=7cm \hrule \kern 6pt \#1\par\kern 9pt}}
\valign{#&\&\&\&\&\&
\h{Tijd}{1cm}&
\t{17:00}&
\t{17:15}&
\t{17:30}&
\t{17:45}\cr
\noalign{\kern 6pt}
\h{When I am dead}{7cm}%
&\span
\c{<<When I am dead (1)>>}%
&\span
\c{<<When I am dead (2)>>
\kern 6pt
\hbox to 7cm{\hss Christina Rossetti}}%
\cr
\noalign{\kern 6pt}
\h{To My Mother}{7cm}%
&\span\span\span\span
\c{<<To My Mother>>
\kern 6pt
\hbox to 7cm{\hss Edgar Allan Poe}}%
\cr
\noalign{\kern 6pt}
\h{Proud Maisie}{7cm}%
&
\c{<<Proud Maisie (1)>>}%
&\span
\c{<<Proud Maisie (2,3)>>}%
&\span
\c{<<Proud Maisie (4)>>
\kern 6pt
\hbox to 7cm{\hss Sir Walter Scott}}%
\cr
}% \valign
```

and of course this input produces a ‘perfect’ result, as can be seen in figure 1.

</tbody>
</table>

4. Using `\starttable` macros

Trying to build a table like this with conventional `\halign`-based table macros is quite a challenge, because quite a lot of data needs to be shuffled around. But there is an even bigger problem...

```
\starttable[|p(1cm)|p(7cm)|p(7cm)|p(7cm)|]
\NC \bold Tijd
\NC \bold When I am dead
\NC \bold To My Mother
\NC \bold Proud Maisie
\NC \NR
\noalign{\medskip}
\NC \hrule \smallskip 17:00
\NC \hrule \smallskip
\vbox to 50pt
{\<<When I am dead (1)>>}
\NC \hrule \smallskip\vbox to 10pt
{\<<To My Mother>>}
\blank \rightline{Edgar Allan Poe}
\NC \hrule \smallskip\vbox to 40pt
{\<<Proud Maisie (1)>>}
\NC \NR
\NC \hrule \smallskip 17:10
\NC
\NC
\NC \hrule \smallskip\vbox to 40pt
{\<<Proud Maisie (2,3)>>}
\NC \NR
```

11
This input produces an okay result (see figure 2).

But take another look at that source code. Not only is all the data pushed around in an odd order, but also a fair number of \vbox commands are needed to make sure the row heights are correct. These \vboxes are needed because of row spanning, of course.

Now, using the example text it is simple to predict the correct heights, but with normal running text, it would be impossible to know how much space is needed before the actual typesetting is done. That height information would need to be saved to be used in a subsequent run to fix the row heights. As the actual running text in our production environment can also contain references, another run would be needed to correct for that too. Of course, after that run the table height will have changed, so yet another run is then needed to make sure the remaining pages in the document are correct.

In the end, this input (and in fact all approaches based on \halign) is undesired in a batch process because it complicates (and slows down) typesetting way too much.
5. Using \bTABLE macros

The \bTABLE environment (so-called ‘natural tables’) is an alternative option for it does not actually use \halign and is therefore freer internally to do processing on measurements. Also, there is built-in support in \bTABLE for row spanning, and, furthermore, it dynamically calculates the column widths if needed. This last point is not the hardest thing to get right, but it is nice to be able to ignore that little detail.

At first glance, the input looks nice except for the reshuffling of the data:

```
\bTABLE
\bTR
  \bTD [style=bold] Tijd\eTD
  \bTD [style=bold] When I am dead\eTD
  \bTD [style=bold] To My Mother\eTD
  \bTD [style=bold] Proud Maisie\eTD
\eTR
\bTR
  \bTD [height=45pt] \hrule \smallskip 17:00\eTD
  \bTD [nr=2] \hrule \smallskip <<When I am dead (1)>>\eTD
  \bTD [nr=4] \hrule \smallskip <<To My Mother>>
    \blank \rightline{Edgar Allan Poe}\eTD
  \bTD \hrule \smallskip <<Proud Maisie (1)>>\eTD
\eTR
\bTR
  \bTD [height=45pt] \hrule \smallskip 17:10\eTD
  \bTD [nr=2] \hrule \smallskip <<Proud Maisie (2,3)>>\eTD
\eTR
\bTR
  \bTD [height=50pt] \hrule \smallskip 17:30\eTD
  \bTD [nr=2] \hrule \smallskip <<When I am dead (2)>>
    \blank \rightline{Christina Rossetti}\eTD
\eTR
\bTR
  \bTD [height=45pt] \hrule \smallskip 17:45\eTD
  \bTD \hrule \smallskip <<Proud Maisie (4)>>
    \blank \rightline{Sir Walter Scott}\eTD
\eTR
\eTABLE
```

However, there are two problems, one minor and one quite big.

1. \bTABLE wants you to not mention cells that have been skipped due to spanning.
   This makes perfect sense in horizontal spanning, but it makes vertical spanning somewhat tricky as you need to keep track of any still active spans from earlier lines.
contextgroup > context meeting 2018

When I am dead, my dearest,
Sing no sad songs for me;
Plant thou no roses at my head,
Nor shady cypress tree:
Therefore by that dear name I long have called you—
You who are more than mother unto me,
And fill my heart of hearts, where Death installed you
In setting my Virginia’s spirit free.

Because I feel that, in the Heavens above,
The angels, whispering to one another,
Can find, among their burning terms of love,
None so devotional as that of “Mother.”
Therefore by that dear name I long have called you—
You who are more than mother unto me,
And fill my heart of hearts, where Death installed you
In setting my Virginia’s spirit free.

And if thou wilt, remember,
And if thou wilt, forget.
And thus are dearer than the mother I knew
By that infinity with which my wife
Was dearer to my soul than its soul-life.

Proud Maisie is in the wood,
Walking so early;
Sweet Robin sits on the bush,
Singing so rarely.

Tell me, thou bonny bird,
When shall I marry me?—
When six braw gentlemen Kirkward shall carry ye."

Who makes the bridal bed,
Birdie, say truly.—
The gray-headed sexton
That delves the grave dully.

The glowworm o’er grave and stone
Shall light thee steady;
The owl from the steeple sing,
‘Welcome, proud lady.’

Christina Rossetti

Sir Walter Scott

Figure 3. The \bTABLE attempt

2. \bTABLE cannot cope with overlapping vertical spans.
Overlapping spans are silently ignored, and I have not found any way to
overcome that. This is a big problem.
Cells that use spanning do not listen to the \texttt{height} parameter, so tweaking
heights does not work. The only way out that I could find to get correct out-
put was to set explicit heights to the cells in the time (‘\texttt{Tijd}’) column. I was
lucky that this column contains no spanning.

The output of this code can be seen in figure 3. In all, besides having cleaner-looking
input, not much progress at all has been made compared to using \texttt{starttable}. In
fact, getting the correct values for the \texttt{height} parameters for the time cells is
even more complicated than figuring out the heights for the \texttt{vbox}es in the earlier
attempt. (I did it by eye in this example).

6. Using \texttt{xtable} macros
There is another option left: the new \texttt{xtables (‘extreme tables’)} environment. The
input looks a lot like the input for \texttt{TABLE} except for more explicit macro names, but
the internal code is completely different.
\texttt{xtables} has the same issue as \texttt{bTABLE} when it comes to skipped cells, but it will
happily handle overlapping vertical spans, which is wonderful!

\begin{verbatim}
\startxtable
\startxrow
\startxcell \textbf{Tijd}\stopxcell
\startxcell \textbf{When I am dead}\stopxcell
\startxcell \textbf{To My Mother}\stopxcell
\startxcell \textbf{Proud Maisie}\stopxcell
\stopxrow
\startxrow
17:00 When I am dead, my dearest,
17:10 be the green grass above me
17:30 I shall not see the shadows,
17:45 That doth not rise nor set,
Sing no sad songs for me;
With showers and dewdrops wet;
I shall not feel the rain;
That doth not rise nor set,
Sing no sad songs for me;
Plant thou no roses at my head,
And if thou wilt, remember,
And if thou wilt, forget.
I shall not feel the rain;
I shall not hear the nightingale
Sing on, as if in pain:
And dreaming through the twilight

Proud Maisie

\end{verbatim}
The output is shown in figure 4. In this source, there is only one tweak that is possibly needed: there are two commented-out lines in the source with `\vadjust{\kern-...}`. If I remove those comments, the extra whitespace below the top row of columns two and four shrink to the point where the output looks just fine. My guess is that with the overlapping spans, ConTeXt is being a bit too conservative in reserving vertical space. Since I am more worried about the correct alignment than with some extra whitespace, I could easily live with that. Besides, I suspect Hans can and will fix this in `xtabular` once given a proper ‘MWE’ demo file.

**Figure 4.** The `\startxtbl` attempt

7. Conclusions

So why do I think there is a case for `\valign` if `xtables` are quite usable? When these table requirements that I show here first appeared, `xtables` did not yet exist.

So I hacked up a copy of the `\starttable` code that uses `\valign`, and that has worked reasonably well for a couple of years now.

I continue to use my hacked `\starttable` solution mostly because I find the needed reshuffling of the data and skipping cells when using `xtables` rather unwieldy.

But I am wondering: since `xtables` are basically framed objects shifted around, could there possibly be a future extension or variation of `xtables` with these two new features?

1. Reverse input order of rows and columns;
2. Allow data in the input for skipped cells  
   (they could even be processed, as a special gimmick)

Even better would be if the `\vadjust` lines would no longer be needed, which is another reason why I will stick with the hacked `\starttable` for now.

Since the process that generates the pdf documents is completely automated, it is not feasible to correct the vertical space manually where needed. And while I could write the suboptimal output off to my clients as a ‘known limitation’, the fact of the matter is that I have a solution already that does work perfectly.

For now, there is no good reason to move away from the `\valign` that it took me so long to discover a need for.
8. Afterword

This paper was presented at the ConTeXt meeting in Sibřina in 2018. Soon afterwards, Hans extended ConTeXt to allow for a \startxcolumn inside xtables. With that, the input can now look like this (result in figure 5):

\startxtable
\startxcolumn
\startxcell \bold Tijd\stopxcell
\startxcell \hrule \smallskip 17:00\stopxcell
\startxcell \hrule \smallskip 17:10\stopxcell
\startxcell \hrule \smallskip 17:30\stopxcell
\startxcell \hrule \smallskip 17:45\stopxcell
\stopxcolumn
